Introduction

This Guidance is a reference to assist you in completing the Sudden Death in the Young (SDY) Autopsy Summary. This summary sheet of autopsy results should be completed following your investigation of a sudden and unexpected death in a child or youth under age 20. It includes instructions for specific components of the autopsy.

The SDY Autopsy Guidance was developed as part of the SDY Case Registry, an initiative of the National Institutes of Health (NIH) and the US Centers for Disease Control and Prevention (CDC). This summary, the guidance and instructions were developed by the SDY Autopsy Protocol Committee composed of medical examiners with experience in pediatric, cardiac and/or neuro pathology; physician coroners, death investigators, and other medical professionals with experience in cardiology, neurology, emergency medicine, public health and genetics.

Your jurisdiction is participating in the Sudden Death in the Young Case Registry with funding from the NIH and CDC. The autopsy findings will be summarized with other case review information and biospecimen data (upon family consent) in the SDY Case Registry. This Registry of de-identified data will be used to better understand the etiologies and risk factors for sudden death in the young so that improved prevention strategies may be developed.

Additional instructions and information are provided throughout this document in italics and footnotes.

SDY Definitions and Inclusion/Exclusion Criteria for the SDY Case Registry

“Sudden” implies death within 24 hours of the first symptom, or those resuscitated from cardiac arrest and dying during the same hospital admission.

“Unexpected” refers to a death in someone who dies from an accidental injury or someone who was believed to have been in good health, or had a stable chronic condition or had an illness but death was not expected. Examples could include hypertrophic or dilated cardiomyopathy, congenital heart disease, epilepsy, asthma and pneumonia.

Inclusion and Exclusion Criteria

This autopsy results summary sheet is a key component of the SDY Case Registry and should be used for all cases that meet all of the following inclusion criteria and none of the following exclusion criteria:

Inclusion Criteria

- Is the child under 20 years old?
  - Yes, Include
  - No, Exclude
- Was the death sudden and unexpected and/or unwitnessed?
  - Yes, Include
  - No, Exclude

Exclusion Criteria

- Was the death caused by an accident in which the external cause was the obvious and only reason* for the death?
  - Yes, Exclude
  - No, Include
  - Include
- Was the death an obvious homicide?
  - Yes, Exclude
  - No, Include
- Was the death an obvious suicide?
  - Yes, Exclude
  - No, Include
- Was the death caused by an accidental or intentional overdose of drugs even if this caused cardiac or respiratory arrest?
  - Yes, Exclude
  - No, Include
- Was the death caused by a terminal illness in which the death was reasonably expected to occur within 6 months?
  - Yes, Exclude
  - No, Include

*Exception: All infants under 1 year of age whose death was caused by suffocation

- Yes, Include
- No, Include
General

Sex:  □  Male    □  Female

Body weight: ____________ kg           Body length: ____________ cm

Head circumference: ____________ cm

External Exam: If abnormalities suggest trauma, disease/syndrome, or medical intervention, please describe:

Photography (external):  □  Yes    □  No

Imaging

(Circle all that were performed and describe the location)

X-Ray, single:

X-Ray, multiple views:

CT scan:

MRI:

Describe any abnormalities found on imaging:

Detailed Review of Specified Organs

Thorax/Lungs

Thorax/Lungs Imaging:

Radiographs of chest  □  Prior to death (hospital, emergency room, other)  □  Postmortem

• If there is a question about the possibility of extra lobar or intra-lobar sequestration, or congenital pulmonary adenomatoid malformation (CPAM; old name CCAM), remove the heart, lungs, central diaphragm, inferior vena cava, and descending aorta as a block, and send for pediatric pathology consultation.

Thorax/Lungs – External Gross Examination

Chest

Contour  □  Normal    □  Abnormal

If abnormal:  □  Increased anteroposterior diameter  □  Asymmetry

Costal margin flaring  □  Other: ____________

Injuries  □  Absent    □  Present:

Axillary lymphadenopathy  □  Absent    □  Present

Other: ____________

Nasal choanae (infants)\(^1\)  □  Patent    □  Obstructed

\(^1\)Testing to see if the nasal choanae are patent may be performed by sounding each nostril with a flexible probe. This can be performed with the nasopharyngeal swab for viral culture.
## Thorax/Lungs — Internal Gross Examination

- **Photography:** (optional)
  - In situ
  - On cutting board
- **Testing:** sampling for viral and bacterial cultures (as indicated)

### Tracheal deviation
- Absent
- Present:
  - Left
  - Right
  - Bilateral

### Lungs
- Pneumothorax
  - Absent
  - Present:
    - Left
    - Right
    - Bilateral
- If present, diagnosed by:
  - X-ray
  - Other means: ________________

### Hypoventilation
- Absent
- Present:
  - Left
  - Right
  - Bilateral

### Lung(s) sunken towards the back
- Absent
- Present:
  - Left
  - Right
  - Bilateral

### Hyperinflation
- Lungs do not approach midline
- Approach midline
- Meet in midline

### Color
- Pink
- Dark red
- Alternating pink and purple
- Fibrinous/purulent exudate
  - Dark red in all lobes, posterior only
  - Other: ________________

### Pleural effusion
- Absent
- Present:
  - Left
  - Right
  - Bilateral
- If present, appearance:
  - Clear
  - Bloody
  - Straw
  - Purulent
  - Other: ________________

### Amount:
   __________________ ml

### Hemidiaphragm elevation
- Absent
- Present:
  - Left
  - Right
  - Bilateral

## Thorax/Lungs — Gross Dissection

- **Take heart and lungs out as a block after inspecting aorta for vascular ring around trachea, and inspecting pulmonary arteries and veins (see heart section).**
- **The trachea / upper respiratory tract should be removed as a block with the lungs.**

### Vascular ring (aorta around trachea)
- Absent
- Present

### Lungs
- Blood on the pleural surface (adherent hemothorax)
  - Absent
  - Present:
    - Acute
    - Chronic
- Blood beneath the pleura
  - Absent
  - Present:
    - Petechiae
    - Confluent/Large hemorrhages
- Necrotic exudate on the pleural surface
  - Absent
  - Present
- Prominent/discolored/dilated lymphatics visible through the pleura
  - Absent
  - Present
- Cobblestoning
  - Absent
  - Present
- Rib markings on the pleura
  - Absent
  - Present

### Other:
   __________________

- **Perform the initial examination of the heart/lung block. If a cardiovascular pathology or pediatric pathology consultation is requested, send the heart/lung block to the consultant. If consultation is not requested, separate the lungs from the heart following the initial examination.**

### Lung weights within normal range for age
- Yes
- No:
  - Increased
  - Decreased

### Right lung approximately 1/3 heavier than the left lung
- Yes
- No: __________________

### Resuscitation-related changes
- Absent
- Present:

### Pulmonary edema, NOS
- Absent
- Present:

### Neurogenic pulmonary edema
- Absent
- Present:

### Pulmonary infection
- Absent
- Present:

### Pulmonary hemorrhage
- Absent
- Present:

### If present:
- Diffuse
- Focal, location: ________________
- Aspiration pattern (follows bronchi)

### Pulmonary hypertension
- Absent
- Present

### Other:

If there is any question whether blood clots in the mainstem pulmonary artery branches are antemortem thromboemboli or postmortem clot, histology is definitive.

Three lobes on the right and two lobes on the left

Does the main bronchus enter the hilum above, or approximately level with, the mainstem pulmonary artery branch on the right side (normal right hyparterial bronchus), and below the mainstem pulmonary artery branch on the left side (normal left hyparterial bronchus)? If abnormal, consider pediatric pathology consultation.

Look for polysplenia.

Look for asplenia.

Look for Kartagener syndrome.

Consider asthma.

Consider infection or sarcoidosis

Propagation of thromboemboli causes red-purple “sausages” to exude from cross-sectioned pulmonary artery branches.

7 If there is any question whether blood clots in the mainstem pulmonary artery branches are antemortem thromboemboli or postmortem clot, histology is definitive.

8 Three lobes on the right and two lobes on the left

9 Does the main bronchus enter the hilum above, or approximately level with, the mainstem pulmonary artery branch on the right side (normal right hyparterial bronchus), and below the mainstem pulmonary artery branch on the left side (normal left hyparterial bronchus)? If abnormal, consider pediatric pathology consultation.
**Thorax/Lungs – Microscopic Examination**

- **Central**
  - Peripheral: including pleura and subpleural pulmonary artery branches and medium-sized bronchi
- **Through areas of grossly evident or suspected disease processes**
  - There is no definitive number of lung sections supported by research that can be stated as required in every case. Peripheral and central lung samples each yield different diagnoses, and both should be sampled. Sampling from multiple areas may detect patchy diseases. Grossly suspicious areas are likely to reward sampling. Storage of multiple lung segments allows further sampling if disease processes are detected that require it.
  - If in doubt, consult a pediatric pathologist.
- **Obtain special stains as indicated for:***
  - Bacterial infection
  - Granulomatous disease (acid-fast bacteria, sarcoidosis, fungi)
  - Autoimmune disease
  - Neoplasia
  - Resolving hemorrhage (iron)

If present, location:

- Bronchi/bronchioles
- Alveoli
- Alveolar walls

**Epiglottis**

- Symmetrical
- Asymmetrical

**Tracheal contents**

- Absent
- Present

If present:

- White foam, pink foam
- Mucus
- Necrotic exudate
- Thin layer of liquid blood along the mucosa
- Pieces of food, vomitus
- Streaking the mucosa
- Obstructing blood clots
- Obstructing food bolus
- Foreign object

---

---

*Including muscle layers in subpleural arterioles; other abnormalities of pulmonary artery branches*
**Heart – Gross Dissection**

- Weigh the heart

- Make note of epicardial adhesions, exudate, or discoloration
  - Make note of amount and distribution of epicardial fat

- Section the epicardial coronary arteries at 3-5 mm intervals, avoiding cutting into great arteries and cardiac chambers
  - Note arterial dominance (right/left/shared) and locations and degrees of obstructions

- Make transverse (short axis) slices through the ventricles beginning 1 cm above the apex and at 1 cm intervals; do not section above the level of the tips of the left ventricular papillary muscles
  - Note all gross lesions in the myocardial sections including scars, discolorations, and softenings
  - Lesions should be described by the usual descriptors (e.g., size, color, firmness) as well as:
    - Vertical location (e.g., basal, midventricular, apical)
    - Lateral location (e.g., anteroseptal, inferolateral)
    - Distribution (e.g., subendocardial, transmural, subepicardial)
      - Take measurements of left ventricular thickness, right ventricular thickness, and septal thickness in the uppermost (most basal) slice
    - When taking measurements, include only the compact myocardium; do not include trabecular muscle or papillary muscles
      - Examine the right ventricular wall for fat infiltration
      - It is recommended that the myocardial slices be photographed, especially if there are grossly visible lesions

- Open the heart in the direction of blood flow:
  - Open the right atrium from the inferior vena cava orifice to the tip of the atrial appendage
  - Open from the right atrium to the right ventricle along the posterior or lateral wall
  - Open the right ventricular outflow tract anteriorly
  - Open the left atrium by connecting all of the pulmonary veins and cutting to the tip of the atrial appendage
  - Open from the left atrium to the left ventricle along the lateral wall
  - Open the left ventricular outflow tract anteriorly

- Remove postmortem clot from all chambers
  - If large amount of postmortem clot is present, consider re-weighing heart after the clot is removed

- Describe degree of dilation of chambers, if any, and document presence/absence of mural thrombi

- Document presence/absence of patent foramen ovale, atrial septal defect, or ventricular septal defect (describe size and location if present)

- Examine the valves, noting number of leaflets/cups of each and presence of any abnormalities (e.g., myxoid change, calcification, vegetations)

- Examine the coronary ostia
  - If ectopic origin is present, note acuity of the origin (e.g., sharp angle of origin), course of the proximal segment of the artery (e.g., within aortic adventitia), and presence/absence of an occlusive ostial flap

- If any of the above findings are present, it is recommended that they be photographed in addition to being described in the autopsy guidance

\(^{\dagger}\)Right atrial morphology includes presence of terminal crest, smooth endocardial surface posterior to terminal crest, pectinate muscles anterior to terminal crest and in atrial appendage.

\(^{\dagger\dagger}\)Antemortem thrombus; excludes perimortem/postmortem clot.
## Heart – Gross Examination (continued)

### Left atrium
- **Morphology**
  - Left (normal)  
  - Right  
  - Ambiguous/other:  
- **Coronary sinus OS**
  - Patent  
  - Stenotic  
  - Atretic  
- **Dilation**
  - Absent  
  - Present:  
    - Mild  
    - Moderate  
    - Severe  
- **Cavitary thrombus**
  - Absent  
  - Present:  

### Atrial septum
- Intact  
- Probe-patent foramen ovale  
- Atrial septal defect:  

### Atrioventricular valves
- **Two valves (right and left)**  
- Common valve (atrioventricular canal)

#### Right atrioventricular valve
- **Morphology**
  - Tricuspid (normal)  
  - Prosthetic: (type)  
  - Other:  
- **Abnormalities**
  - Absent  
  - Present: If present, circle/describe all that apply:
    - Vegetations  
    - Prolapse/ballooning  
    - Commissural fusion  
    - Other:  

#### Left atrioventricular valve
- **Morphology**
  - Mitral (bicuspid, normal)  
  - Prosthetic: (type)  
  - Other:  
- **Abnormalities**
  - Absent  
  - Present: If present, circle/describe all that apply:
    - Vegetations  
    - Prolapse/ballooning  
    - Commissural fusion  
    - Other:  

### Right ventricle
- **Morphology**
  - Right\(^{22}\) (normal)  
  - Left  
  - Ambiguous/other:  
- **Wall thickness\(^{23}\)**
  - Anterior:  
  - Posterior:  
- **Fat infiltration\(^{24}\)**
  - Absent  
  - Present:
    - If present, which wall:  
      - Anterior  
      - Posterior  
    - Maximum % thickness of wall involved:  
- **Right ventricular thinning\(^{24}\)**
  - Absent  
  - Present, location:  
- **Dilation**
  - Absent  
  - Present:  
    - Mild  
    - Moderate

  - Inferior/posterior:  
- **Dilation**
  - Absent  
  - Present:  
    - Mild  
    - Moderate  
    - Severe  
  - If present, chamber diameter (at same level as wall thicknesses):  
- **Cavitary thrombus**
  - Absent  
  - Present:  
- **Endocardium**
  - Thin, translucent (normal)  
  - Abnormal:  
- **Myocardial infarction (acute/recent)**
  - Absent  
  - Present:  
- **Myocardial scar\(^{26}\)**
  - Absent  
  - Present:  
- **Myocardial discoloration**
  - Absent  
  - Present:  

---

\(^{19}\)Left atrial morphology includes absence of terminal crest and smooth endocardial surface throughout atrium except for pectinate muscles in atrial appendage.  
\(^{20}\)Description should include location, size, and any intervention.  
\(^{21}\)Describe morphology and pathology under "Left atrioventricular valve" section.  
\(^{22}\)Right ventricular morphology includes coarse endomyocardial trabeculations and presence of a moderator band.  
\(^{23}\)Measurements should be taken at the level of the tips of the ventricular papillary muscles and should include only the compact myocardium (not epicardial fat or papillary/trabecular muscle).  
\(^{24}\)Concerning for arrhythmogenic right ventricular cardiomyopathy  
\(^{25}\)Left ventricular morphology includes fine endomyocardial trabeculations and absence of a moderator band.  
\(^{26}\)Includes remote myocardial infarctions
Heart – Gross Examination (continued)

Ventricular septum
- Septal thickness\(^{27}\) cm  ❑ Intact  ❑ Ventricular septal defect\(^{28}\)

Semilunar valves  ❑ Two valves  ❑ Single valve\(^{29}\) (truncus arteriosus, pulmonary or aortic atresia)
  - If two valves:  ❑ Aorta posterior and rightward of the pulmonary valve (normal)
    ❑ D-malposed\(^{30}\)  ❑ Other arrangement:

Right semilunar valve
  - Number of cusps  ❑ 3 (normal)  ❑ 2 (bicuspid)  ❑ Other:  ❑ Prosthetic (type)  ❑
  - Abnormalities  ❑ Absent  ❑ Present: If present, circle/describe all that apply:
    - Vegetations  ❑
    - Thickening  ❑
    - Calcification  ❑
    - Perforation  ❑
    - Commissural fusion  ❑
    - Other:  ❑

Left semilunar valve
  - Number of cusps  ❑ 3 (normal)  ❑ 2 (bicuspid)  ❑ Other:  ❑ Prosthetic (type)  ❑
  - Abnormalities  ❑ Absent  ❑ Present: If present, circle/describe all that apply:
    - Vegetations  ❑
    - Thickening  ❑
    - Calcification  ❑
    - Perforation  ❑
    - Commissural fusion  ❑
    - Other:  ❑

Great vessels
  - Pulmonary artery  ❑ Normal  ❑ Dilated  ❑ Hypoplastic
    - Discontinuous branch pulmonary arteries  ❑ Absent  ❑ Present
    - Supravalvar pulmonary stenosis  ❑ Absent  ❑ Present:  ❑ Mild  ❑ Moderate  ❑ Severe
    - Thromboemboli  ❑ Absent  ❑ Present:  ❑
  - Aorta\(^{31}\)  ❑ Leftward arch (normal)  ❑ Rightward arch
    - Other arch anomaly (e.g., vascular ring)  ❑ Absent  ❑ Present:  ❑
    - Root dilatation  ❑ Absent  ❑ Present: cm (circumference)
    - Dissection  ❑ Absent  ❑ Present: (type) Ruptured?  ❑ Yes  ❑ No
    - Coarctation/Interruption  ❑ Absent  ❑ Present
    - Supravalvar aortic stenosis  ❑ Absent  ❑ Present:  ❑ Mild  ❑ Moderate  ❑ Severe
    - Ductus arteriosus  ❑ Ligamentous (ligamentum arteriosum)  ❑ Present, closed
      ❑ Probe patent  ❑ Visibly patent: mm (diameter)

Coronary arteries
  - Ostia  ❑ Normal\(^{32}\)  ❑ Abnormal: (e.g., stenosis)  ❑
  - Distribution  ❑ Normal, right dominant  ❑ Normal, left dominant\(^{33}\)  ❑ Abnormal
    If abnormal  ❑ Single  ❑ Left anterior descending from right  ❑ Circumflex from right
    ❑ Other:  ❑
  - Aneurysm  ❑ Absent  ❑ Present:  ❑
  - Dissection  ❑ Absent  ❑ Present:  ❑
  - Narrowing  ❑ Absent  ❑ Present:  ❑ Atherosclerotic  ❑ Non-atherosclerotic

\(^{27}\) Measurement should be taken at the level of the tips of the left ventricular papillary muscles.
\(^{28}\) Description should include location, size, and any intervention. If malalignment is present (e.g., as in tetralogy of Fallot), describe extent and direction – anterior or posterior.
\(^{29}\) Describe morphology/pathology in “Left semilunar valve” section.
\(^{30}\) D-malposition is commonly referred to as “complete transposition” (i.e., aorta is anterior and rightward of the pulmonary artery).
\(^{31}\) The aorta is the vessel that gives rise to the coronary arteries.
\(^{32}\) “Normal” includes origin of the conus artery adjacent to right coronary ostium (normal variant).
\(^{33}\) The right coronary artery may be small in left-dominant hearts. Describe in further detail in “Other” section if absent/hypoplastic or if downstream sequelae exist (e.g., myocardial infarction).
SUDDEN DEATH IN THE YOUNG AUTOPSY GUIDANCE

If atherosclerosis is present, fill out the following table:

  ___________________________
- Other: ___________________________

\(^{34}\)Probe patent foramen ovale is considered a normal variant and should not be included under congenital heart disease.

\(^{35}\)Surgical status will be recorded under evidence of cardiovascular interventions

\(^{36}\)With the exception of valve prostheses, which should be described in the valve sections above.
### Heart – Microscopic Examination (Describe findings on page 17)

The extent of microscopic examination is guided by the available history and the gross findings.

For a grossly normal heart, at a minimum:
- 2 sections of left ventricle that include the anterolateral and posteromedial papillary muscles
- 1 section of basilar ventricular septum
- 1 section of right ventricle
- An additional 4-6 sections of myocardium taken from a variety of locations in the ventricles and septum (to look for myocarditis, which can be patchy; if there is recent history of viral illness, it is advisable to take more)

Myocardium:
- Take sections of any areas of discoloration, softening, or mass.
- Taking sections of old myocardial infarction scars is usually uninformative, but areas of myocardium with randomly dispersed interstitial scars should be sampled.
- In cases of suspected hypertrophic cardiomyopathy, the ventricular septum should be carefully sampled to look for myocyte disarray.
- In cases of suspected arrhythmogenic right ventricular cardiomyopathy, multiple sections of the anterior and posterior walls of the right ventricle should be taken.
- Make note of:
  - Hypertrophy
  - Myocyte disarray
  - Necrosis (coagulative vs. contraction-band; focal vs. geographic; specific distribution)
  - Fibrosis (replacement vs. interstitial; specific distribution)
  - Inflammation (prominent cell type(s); presence/absence of myocyte necrosis)
  - Infiltrate (e.g., fat, amyloid)
  - Epicardial surface (e.g., presence/absence of inflammation and exudate)
  - Epicardial arteries (atherosclerosis)
  - Intramyocardial arteries (thrombi, fibromuscular dysplasia)

Coronary arteries:
- Take sections of the greatest area of obstruction of each artery.
- Take sections of any other grossly visible lesion (e.g., aneurysm, dissection); consider including elastic stain.

Valves:
- Take sections of any vegetations (consider including Brown & Brenn tissue gram stain).
- Take a section of a mitral leaflet if it appears to have myxoid degeneration (include an Alcian Blue (AB)-Periodic acid-Schiff (PAS) stain).

Conduction system:
- Examination of the conduction system should be done in all cases where:
  - There is documented history of heart block, OR
  - The decedent is an infant/small child and there is a known history of maternal lupus, OR
  - Myxoid valvular disease is present.

- If number of histology blocks is not a financial consideration, doing microscopic examination of the conduction system should be considered in any apparent sudden cardiac death case.

### Brain – Gross Examination (Describe findings on page 17)

- Photographs should be taken with the brain in place and cranial vault removed. This is helpful for evaluation of brain swelling.
  - All photographs should be made with a ruler.
  - Photographs:
    - Vertex view
    - Right view
    - Left view
    - Base View

- Photographs:

Brain weight (unfixed)\(^{38}\)

- Fix brain in 10 – 20% buffered formalin for 2 weeks or longer.\(^{40,41}\)
- Suspend brain so that is not deformed by container. This can be done by suspension with a thread under the basilar artery or by using concentrated formalin until the brain floats
- Request antemortem imaging reports if available for review prior to cutting.

Brain weight (fixed):__________g

\(^{38}\)Removal by forensic pathologist is recommended. This decreases the chances of artifacts, such as tearing of cranial nerves.

\(^{40}\)Skip this step if the brain is very fragile and the brain can be fixed.

\(^{42}\)As in a malformation such as Arnold Chiari

\(^{41}\)In some jurisdictions the family must be notified if the brain is retained for fixation.

\(^{39}\)Except in jurisdictions in which this is not allowed.

* Separate brainstem/cerebellum by horizontal cut through the midbrain.*

Aqueduct: Normal Obstructed Dilated

* Cut the cerebrum in the coronal plane at 1.5 – 2.0 cm intervals.
* Separate the brainstem from the cerebellum by cutting the cerebellar peduncles.
* Divide the cerebellum in midline; slice each hemisphere with sagittal cuts at 0.5 cm intervals.
* Section the brainstem at 0.3 cm intervals.

Photograph the cut brain sections.*

**Brain – Microscopic Examination (Describe findings on page 17)**

- Take sections of any abnormal areas
  - Amygdala
  - Hypothalamus
  - Cerebellum including dentate nucleus and folia

- Also take sections of:
  - Dura
  - Frontal cortex including subcortical white matter
  - Parietal cortex including subcortical white matter
  - Temporal cortex including subcortical white matter and ependymal surface
  - Right hippocampus at level of lateral geniculate nucleus
  - Left hippocampus at level of lateral geniculate nucleus

- Keep sectioned brain in formalin until histologic examination is complete.
- Retain brainstem and hippocampi.

**Gastrointestinal Tract – Gross Examination**

External Examination

Abdominal distention
  - Absent
  - Present

  - If present: Postmortem gas
  - Asymmetry
  - Fluid wave

Scar(s) from previous abdominal surgery
  - Absent
  - Present

External feeding tube
  - Absent
  - Present

Internal Examination

- Photography: optional
- In situ
- On cutting board
- Testing: sampling for viral and bacterial cultures (as indicated)

Peritoneal Cavity

- Evidence of peritonitis
  - Absent
  - Present: ________________________________

- Ruptured abdominal organ

- Volvulus  □ Absent  □ Present:

- Intussusception  □ Absent  □ Present:

- Appendicitis  □ Absent  □ Present:

- Foreign object in the peritoneum  □ Absent  □ Present:

• Examine the tongue. During examination look for tongue bites if the child has teeth; examine the area of the foramen cecum for a visible or microscopic trace of the origin of the thyroid gland.

Liver weight within normal range for age  □ Yes  □ No: □ Larger □ Smaller

If the liver is enlarged, does it appear to be a sequela of right heart failure (not a primary liver problem)?  □ Yes  □ No

• Look at the epiglottis (may fall under respiratory/trachea).

- Open the esophagus, stomach, and duodenum, and consider opening the jejunum and ileum (strongly recommended).

- Open the large bowel.

- Use dissection or the squeeze test to evaluate whether the biliary tree passes bile.

- Open the gallbladder; optional, obtain bile for later evaluation.

- Section the liver and the pancreas.

- The pancreas may be sectioned with the duodenum and ampulla (preferred), or after separation from the duodenum.

Pancreatitis  □ Absent  □ Present:

Adhesions/sequelae of surgery

□ Absent  □ Present:

Bleeding  □ Absent  □ Present:

Thrombosis  □ Absent  □ Present, vessel:

Obstruction  □ Absent  □ Present:

Dilatation  □ Absent  □ Present:

□ Absent  □ Present:

Masses - wall, including reduplications

□ Absent  □ Present:

Masses in the lumen

□ Absent  □ Present:

Intussusception

□ Absent  □ Present:

Volvulus  □ Absent  □ Present:

Toxic megacolon

□ Absent  □ Present:

Prolapse (rectal or other)

□ Absent  □ Present:

Reflux  □ Absent  □ Present:

Inflammation  □ Absent  □ Present:

Diarrhea  □ Absent  □ Present:

Constipation  □ Absent  □ Present:

Sequelae of necrotizing enterocolitis

□ Absent  □ Present:

Sequelae of G.I. diseases/infections

□ Absent  □ Present:

Congenital abnormalities

□ Absent  □ Present:

\(^48\) In neonates, systemic Herpes infection may include hepatitis.
Gastrointestinal Tract – Microscopic Examination *(Describe findings on page 17)*

- Take sections of any abnormal areas.
- Also take sections of:
  - Tongue at foramen cecum (optional)
  - Epiglottis (optional)
  - Proximal esophagus (optional)
  - Gastroesophageal junction, for reflux (required in infants; optional in children/young adults)
  - Gastric wall (optional)
  - Pyloroduodenal junction (recommended in infants; optional in children and young adults)
  - Proximal duodenum (if evaluating for villous atrophy, some immunodeficiency syndromes, or parasites; optional otherwise)
  - Ampulla of Vater with adjacent duodenum and head of the pancreas (optional)
  - Tail of the pancreas (optional)
  - Liver
  - Gallbladder, biliary tree (optional)
  - Jejunal and ileal sections (if evaluating for villous atrophy, enteritis, or parasites; optional otherwise)
  - Ileoceleal junction (recommended in infants; optional in children and young adults)
  - Appendix tip or base (optional)
  - Ascending or transverse colon (optional)
  - Descending or rectosigmoid colon (recommended in infants and children; optional in children and young adults)
  - Anorectum (optional)

**Specimens**

The following should not be construed as requiring every sample for every examination, but should guide the autopsy physician’s selection of specimens recovered based upon antemortem signs and symptoms and postmortem anatomic findings.

- Nasopharyngeal swab for viral culture
- Cerebrospinal fluid
- Blood cultures
  - Aerobic
  - Anaerobic
- Trachea
  - Culturette
  - Fresh tissue (obtained in a sterile fashion)
- Bronchus
  - Culturette
  - Fresh tissue (obtained in a sterile fashion)
- Lung culturette(s)
  - Right upper lobe
  - Right middle lobe
  - Right lower lobe
  - Left upper lobe
  - Left lower lobe
- Sterilely obtained fresh lung tissue
  - Right upper lobe
  - Right middle lobe
  - Right lower lobe
  - Left upper lobe
  - Left lower lobe
- Stool sample

Were additional specialists consulted on this autopsy (e.g., cardiac pathologist, neuropathologist)?  Yes  No

If yes, specify: ____________________________
